Each pattern π represents an infinite set $[\![\pi]\!]$ of graph databases:

$\llbracket \pi \rrbracket = \{ G \mid \text{there is a homomorphism from } \pi \text{ to } G \}$

・ロット (四) (山) (山) (山) (山) (山) (山)

Using Graph Patterns to query databases

A graph query Q consists of:

- a graph pattern
- a tuple of output variables

Intuitively,

Select all tuples of nodes that *realize* the pattern on a graph.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Intuitively,

Select all tuples of nodes that *realize* the pattern on a graph.

Defining Classes of patterns according to their features

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Features:	node variables (nv) label variables (lv)
	regular expressions in the edges (re)

We define $\boldsymbol{\mathcal{P}}^{\sigma}$, for $\sigma \subseteq \{nv, lv, re\}$

Defining Classes of patterns according to their features

	node variables (nv)
Features:	label variables (lv)
	regular expressions in the edges (re)

We define \mathcal{P}^{σ} , for $\sigma \subseteq \{nv, lv, re\}$

- ► **P**: subgraph isomorphism
- $\mathcal{P}^{\text{nv}, re}$: Essentially CRPQ queries
- $ightarrow \mathcal{P}^{
 m nv, lv}$: Can only use variables, but no expression in the edges

We classify classes of patterns in terms of the sets that they can represent

We classify classes of patterns in terms of the sets that they can represent

Combined and data complexity

Querying Graph Patterns

By means of certain answers:

$$\operatorname{certain}(Q,\pi) = \bigcap \{Q(G) \mid G \in \llbracket \pi \rrbracket\}.$$

- Combined and data complexity
- Full classification for CRPQs
- Upper bounds are maintained for the most general case

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Combined complexity

For CRPQ's:

▲ロト ▲母 ▶ ▲ 臣 ▶ ▲ 臣 ● りへぐ

Combined complexity

For CRPQ's:

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○ ○

General upper bound:

The combined complexity of arbitrary graph queries on arbitrary patterns is in EXPSPACE.

Data Complexity

For CRPQ's:

Data Complexity

For CRPQ's:

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○ ○

General upper bound:

Data complexity of arbitrary graph queries over arbitrary graph patterns is in ${\rm CONP}.$

 $\blacktriangleright \mathcal{P}^{\mathrm{nv}}$: naive tables

◆□▶ ◆□▶ ◆ □▶ ★ □▶ - □ - のへぐ

• \mathcal{P}^{nv} : naive tables

 \blacktriangleright Intractable for ${m {\cal P}}^{
m lv}$ or ${m {\cal P}}^{
m re}$

• $\mathcal{P}^{\mathrm{nv}}$: naive tables

 \blacktriangleright Intractable for ${m {\cal P}}^{
m lv}$ or ${m {\cal P}}^{
m re}$

Restrictions:

- Structure: underlying graphs
- Codd patterns

A pattern is in ${m {\cal P}}_{\rm Codd}^{
m nv, lv}$ if every variable occurs at most once in it

Attempts to put restriction in the structure are not very good:

Attempts to put restriction in the structure are not very good:

(日) (日) (日) (日) (日) (日) (日) (日)

CONP-hard for *paths* in \mathcal{P}^{lv} . CONP-hard for *DAGs* in \mathcal{P}^{re} or *DAGs* in \mathcal{P}^{lv}_{Codd} .

Attempts to put restriction in the structure are not very good:

CONP-hard for *paths* in \mathcal{P}^{lv} . CONP-hard for *DAGs* in \mathcal{P}^{re} or *DAGs* in \mathcal{P}^{lv}_{Codd} .

► The only possibility appears to be patterns in P^{nv,lv}_{Codd} or P^{nv,re} with nice underlying graphs.

Bounded treewidth gives us tractability (data complexity)

The treewidth of a pattern π is the treewidth of its underlying graph.

Bounded treewidth gives us tractability (data complexity)

The treewidth of a pattern π is the treewidth of its underlying graph.

Theorem:

Query answering is in PTIME for CRPQ's over classes of patterns in $\boldsymbol{\mathcal{P}}^{\mathrm{nv},\mathrm{lv}}_{\mathrm{Codd}}$ or $\boldsymbol{\mathcal{P}}^{\mathrm{nv},\mathrm{re}}$ with bounded treewitdh.

・ロット (雪) (日) (日) 日

- Certain paths contain all words of length m
- The size of each certain path is greater than 2^m
We introduce Incomplete automata

In essence, a graph pattern with distinguished initial and final nodes

◆□▶ ◆□▶ ◆ □▶ ★ □▶ - □ - のへぐ

We introduce Incomplete automata

In essence, a graph pattern with distinguished initial and final nodes

Some results:

The smallest NFA representing the certain paths can be doubly-exponential in the size of π.

We introduce Incomplete automata

In essence, a graph pattern with distinguished initial and final nodes

Some results:

- The smallest NFA representing the certain paths can be doubly-exponential in the size of π.
- Checking wether there exists a certain path is EXPSPACE-complete.
- Checking if a word is a certain path is CONP-complete.

(日) (日) (日) (日) (日) (日) (日) (日)

We study how to query graph patterns

How *features* of patterns affect query answering:

- Each feature strictly increases the expressivity of patterns
- ▶ Features have to be carefully chosen to guarantee tractability

(日) (日) (日) (日) (日) (日) (日) (日)

- We identify classes with PTIME query answering
- And others for which we hope to find good heuristics

We study how to query graph patterns

How *features* of patterns affect query answering:

- Each feature strictly increases the expressivity of patterns
- ▶ Features have to be carefully chosen to guarantee tractability
- We identify classes with PTIME query answering
- And others for which we hope to find good heuristics

Starting point for research in *schema mappings*, *exchanging* and integrating graph data.
